putting paper in its *place*

Quillix™

Low-Cost, Web-Based Document Capture

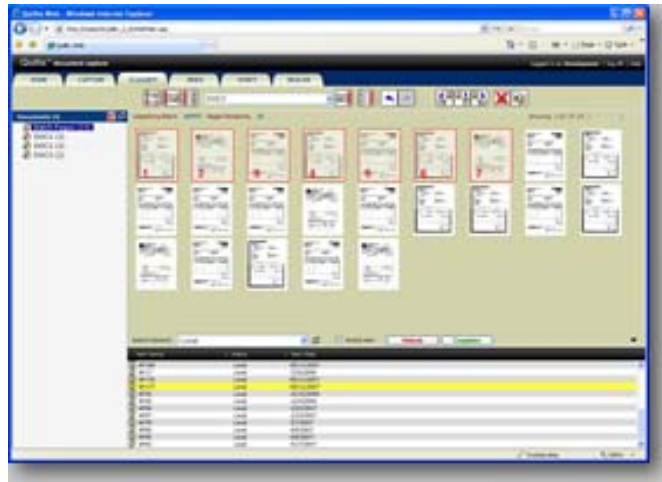

Distributed Internet Capture

Quillix Capture was designed from the very beginning to be distributed. In a joint development effort, Prevalent Software and IDT pioneered the technology in late 1999 while other capture companies were focusing on thick capture clients and proprietary scanning hardware. We had a vision of capturing documents from anywhere in the world with an easy to deploy web-based capture client. As browser technology matured and internet bandwidth increased, we came to believe that the **thin client** capture application could be the main capture application, and have since focused on building **production capture features** into our thin Quillix Capture Client.

The Thin Advantage

The Quillix Capture Client packs plenty of **production capture** features into a thin **browser-based** application that is easily deployed to any desktop in the world with an internet connection and a browser. Documents can be scanned with any **TWAIN** scanner or imported from the desktop.

Getting documents from their source into a repository is a snap. Documents are securely transmitted from the Quillix Capture Client to the Quillix Server one at a time, or in bulk over an internet connection.

Distributed to the MAX!

Quillix Capture does so much more than just remote scanning and uploading of documents from distributed locations, it allows **people** in different locations around the world to **work together** to accomplish sophisticated capture tasks. Quillix Capture uses a unique **business process engine** complete with a **visual workflow designer** and flexible **processing queues** to allow people to work together across the world like no other capture product can. **SCAN** in Sydney, **INDEX** in London, **APPROVE** in New York, **STORE** in San Diego! The possibilities are endless with Quillix.

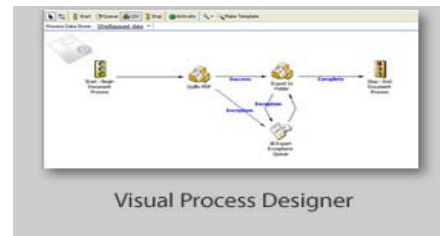

Quillix Visual Capture Workflow

The **power** behind the Quillix Capture system is its one-of-a-kind **business process engine**. Developed by business process automation **experts** with over **30 years** combined workflow and business process automation experience, Quillix Capture addresses document capture automation like **no other capture product** on the market.

Visual Process Designer

Quillix Capture includes an integrated **Visual Process Designer** for designing capture processes easily and efficiently. The Visual Process Designer allows analysts and administrators to create business processes visually by simply drawing a map. **Powerful and flexible** business processing rules are implemented through data-driven wizards and easy to use visual dialogs.

Quillix Capture Stands Alone

When it comes to automating document capture, Quillix stands alone in its ability to create flexible document capture processes on the fly and with ease. **No programming is required!** Quillix Capture also includes many **Enterprise Class** features for managing large sophisticated capture processes, such as process templates and the ability to import and export processes between test, development and production capture systems. In addition, Quillix Capture is integrated with **Active Directory Services** and **LDAP** for management of user accounts on a large scale.

Extensibility and Architecture

Quillix Capture is completely extensible through its **Quillix Server eXtension (QSX)** architecture, allowing third-party developers and integrators to create fully plug-able processing modules for Quillix. The Quillix Development Team uses this architecture in-house to develop modules for Quillix including **Barcode Recognition, OCR/ICR, PDF Conversion** and many others.

Capturing E-Mail and Faxes with Quillix - It's a SNAP!

Capturing and managing email and fax communications has become a high priority for many organizations. **Quillix Capture** is a complete capture solution, providing options for capturing all organizational documents and information from one single platform. The **Email & Fax Gateway** for Quillix Capture is a specialized **Input Source** that monitors POP3 & IMAP email boxes for incoming mail, and imports email from monitored mailboxes into Quillix Capture for processing. The **Quillix Fax** input source (optional) provides a direct interface with leading fax server software from Captaris and Biscom. The Quillix Fax input source automatically monitors fax mail boxes and imports faxes for processing **as soon as they are received** by the fax server.

Quillix in the Mail Room - Quillix Capture + Opex AS3600i = Digital Mailroom

Quillix Capture is uniquely suited to work with mailroom capture devices such as the Opex AS3600i Automated Extraction Desk to fully automate mailroom operations. With its powerful business process engine Quillix works in concert with the high-powered Opex AS3600i to **electronically recognize** and **distribute** documents to the correct people or departments in an organization.

The Opex OXI Input Source

Quillix Capture is specifically integrated using the Opex OXI language to take advantage of Opex AS3600i features, and provide the greatest operational flexibility. The **Open Input Architecture** of Quillix Capture is what makes it all possible. Quillix Capture is designed with a modular Input Source Architecture, allowing third-party integrators and developers to easily integrate capture devices and documents in any format.
